Abstract

This manual describes the inventory of linguistic relations used in the Copenhagen Dependency Treebanks, a set of parallel treebanks for Danish, English, German, Italian, and Spanish annotated with respect to syntax, morphology, discourse, coreference, and translational equivalence. The manual is generated automatically from the CDT project's online relation spreadsheet.[1]

Chapter 1

Introduction

This manual describes the relations used in the Copenhagen Dependency Treebanks. The relations are ordered in a hierarchy, where each relation may have zero or more immediate super types, and zero or more immediate subtypes. The relations are presented in detail in the following chapters, grouped by linguistic level and general relation type. Every time a relation is introduced, its name is written in the left margin, with an indication of its immediate super types and the row in the online CDT spreadsheet in which the relation was defined. An example is shown below.

relation
isa super
[12]

The notation in the left margin indicates that we now describe the relation relation; it has immediate super type super and is defined in row 12 in the spreadsheet. When describing a relation, we also lists its other properties, if relevant, including its:

- *long name*: we use short names in the annotation for brevity, but long names are sometimes more descriptive, so we provide these as an alias for the short relation name;
- *deprecated names*: when renaming relations, the old name is listed as a deprecated name for backwards compatibility, but it should be avoided in future annotation;
- *immediate subtypes*: the relation names that have been specified as the immediate subtypes of the relation;
- *related types*: lists the relations that are closely related to this relation, in some way or another, and which you might want to consult for clarification or additional information;
- *examples*: small annotated text examples that illustrate how the relation is used;

In PDF versions of this document, relation names are clickable so that you can navigate through the relation hierarchy by clicking on the relation names.

Top-level relations: ANY

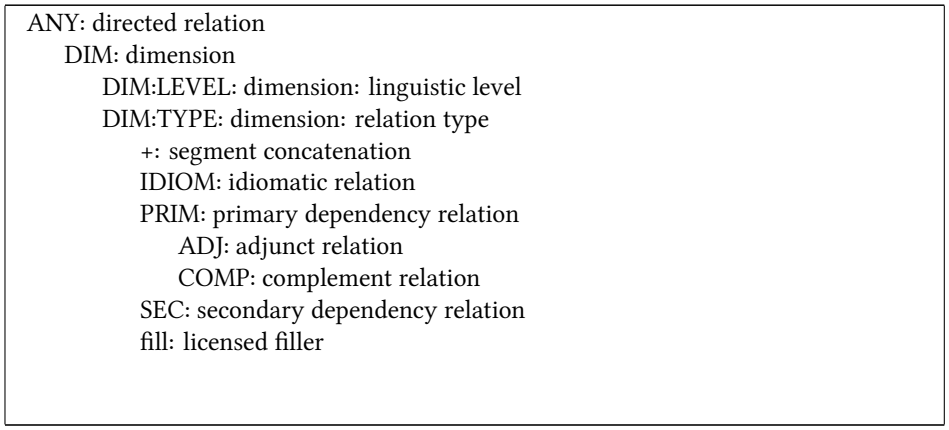

Figure 2.1: The relations matching ANY-TOPICS-SYNTAX-MORPHOLOGY-DISCOURSE-ANAPHORA-SEMANTICS-ALIGNMENT-RULE.

ANY [4] *Directed relation.* An arbitrary directed relation between two tokens. The arrow goes from parent (head, governor, nucleus) to child (dependent, satellite).

Subtypes: DIM RULE TOPICS.

DIM isa ANY [5] *Dimension* (long: DIMENSION). A dimension in the hierarchy. Eg, linguistic level and relation type.

Subtypes: DIM:LEVEL DIM:TYPE.

DIM:LEVEL isa DIM [6] *Dimension: linguistic level.* Dimension specifying the linguistic level of the relation. The classification of relations into linguistic levels is slightly arbitrary (there will be borderline cases where there is no single natural classification), and does not carry any deep linguistic significance. It is more a question about linguistic convention and research tradition than about any deep underlying difference between relations.

Subtypes: ALIGN ANA DISC MORPH SEM SYN.

DIM:TYPE isa DIM [7] *Dimension: relation type.* Dimension specifying the type of the relation.

Subtypes: + IDIOM PRIM SEC fill.

+ isa DIM:TYPE [31] *Segment concatenation* (long: CONCATENATION). A concatenation relation between two adjacent segments. This relation is used if an indecomposable lexeme has mistakenly been seg-

mented into two segments. Lexicalized complex expressions are instead marked as IDIOM relations with the ”#” suffix.

Related types: IDIOM.

IDIOM *Idiomatic relation.* An idiomatic relation. Ie, a relation between tokens in a complex lexicalized expression that form a single lexical unit.
isa DIM:TYPE
[32]

Subtypes: PRIM”#”.

PRIM *Primary dependency relation* (long: PRIMARY). A primary dependency relation. Ie, a relation which specifies the primary head (the governor) of a token (the dependent).
isa DIM:TYPE
[24]

Subtypes: ADJ COMP.

ADJ *Adjunct relation* (long: ADJUNCT). A primary adjunct relation. The relation is licensed by the adjunct, ie, the lexical entry of the adjunct specifies the permissible adjunct frames for the adjunct (ie, the permissible adjunct roles and the restrictions on the governor, eg, with respect to word class). In the compositional semantics, the adjunct acts as functor with the governor as argument.
isa PRIM
[26]

Subtypes: DISCOTHER DISCPRAG DISCSEM SYNADJ.

COMP *Complement relation* (long: COMPLEMENT). A primary complement relation. The relation is licensed by the governor, ie, the lexical entry of the governor specifies the complement frames that it allows (the complement frame specifies the permissible complement roles, and the lexical restrictions on the complements, eg, with respect to word class). In the compositional semantics, the complements act as arguments with the governor as functor.
isa PRIM
[25]

Subtypes: ”@”adverb SYNCOMP.

SEC *Secondary dependency relation* (long: SECONDARY). A secondary dependency relation. Eg, the secondary dependency relation in filler-gap constructions such as relatives without a relative pronoun (the relativized noun is a secondary dependent of the relative verb), raising and control constructions, and elliptic coordinations.
isa DIM:TYPE
[27]

Subtypes: ”[”PRIM”]” ”{”SEM”}”.

fill *Licensed filler.* A relation from a filler licensor to a phonetically empty filler that it licenses. Filler relations are never annotated explicitly in the CDT annotation, but play an important role in the underlying linguistic theory, Discontinuous Grammar. In DG, a ”filler” is a phonetically empty constituent which is licensed lexically by a ”filler licensor” lexeme (eg, the relative verb in a relative construction acts as filler licensor for a filler that essentially provides a copy of the relativized noun, and in control constructions, the controlling verb passes on a copy of the controlled complement to the subordinate verb).

Syntactic relations: SYNTAX

SYN: syntax level

Figure 3.1: The relations matching SYNTAX-SYNCOMP-SYNADJ-TOPICS.

SYN
isa DIM:LEVEL
[16]

Syntax level (long: SYNTAX). A relation at the syntactic level. Ie, a relation between two segments within a sentence, but not within a single word.

Subtypes: SYNADJ SYNCOMP.

3.1 Complement relations: SYNCOMP

SYNCOMP
isa COMP SYN
[75]

Syntactic complement. A syntactic complement role. Complements are lexically licensed by their governors. In the functor-argument structure, they act as functors with the complements as arguments.

In Discontinuous Grammar, a ”filler” is a phonetically empty constituent which is licensed lexically by a ”filler licensor” lexeme (eg, the relative verb in a relative construction acts as filler licensor for a filler that essentially provides a copy of the relativized noun). A ”filler object” is reserved for the special case where a particular word (eg, a relative pronoun) must consume a filler (eg, the filler created by the relative verb). That is, most of the constructions which include a ”ref” relation in the CDT involve the use of a filler object in the detailed theoretical account in Discontinuous Grammar.

isa SYNCOMP one additive and one numeral complement, both optional. The numerical value associated
[94] with the expression is the value M * N + A, where M is the numerical value of the multiplicative complement, A is the numerical value of the additive complement, and N is the numerical value associated with the lexical numeral itself. Eg, ”two hundred four” has value ”2 * 100 + 4”, ”two hundred four thousand” has value ”(2 * 100 + 4) * 1000”, and ”two hundred four thousand and twenty three” has value ”(2 * 100 + 4) * 1000 + (20 + (3))”.

Prepositional object. A prepositional object relation. The governor may be a verb, noun, adjective, adverbial, or another preposition. The preposition is analyzed as the head of the prepositional object itself. If the prepositional object is part of a deverbal NP (ie, an NP where the nucleus is derived from a verb), the CDT annotation specifies the underlying role of the NP within the PP by adding a "." followed by the underlying role to the relation, e.g., "pobj.subj" (the NP in the PP would act as subject in the underlying V), "pobj.dobj", "pobj.pobj", and "pobj.iobj"; in these cases, the semantic role "{SEMROLE}" must be annotated as well (the most relevant semantic roles in this context are "agent", "patient", "recipient", "experient", "location").

expl isa subj [79]
Expletive subject. An expletive subject relation. The expletive subject is typically a situational place adverbial like "there" or time adverbial like "now", and is only possible for verbs that support the expletive alternation. The expletive alternation applies to all verbs that do not have a direct object (this observation, due to Richard Hudson, can be used as a test to distinguish between direct and indirect objects in verbs that take a single object). The alternation creates a new lexicalization of the verb by demoting the original subject to the vacant direct object role (with the restriction that only indefinites are allowed in this direct object role), and letting the subject role be filled by a situational place or time adverbial.

isa SYNADJ noun/determiner. In Germanic languages, adjectives are assumed to modify the determiner
[112] (because of the strong/weak congruence between determiner and adjective), or the noun if no determiner is present; in Romance languages, adjectives are assumed to modify the noun even if there is a determiner, and the determiner is only analyzed as the head if no noun is present (eg, in partitive constructions). The only exception to this rule is when the adjective and the noun form a compound, in which case the adjective is always analyzed as a "attr#" dependent of the lexical noun in both Germanic and Romance languages, even if a determiner is present.

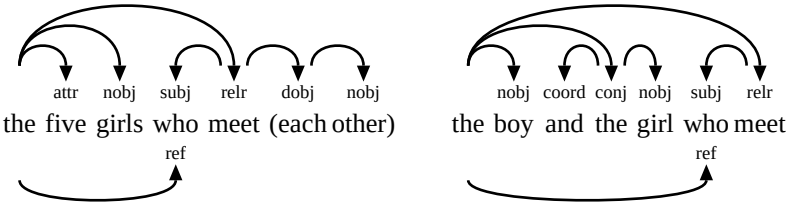
rel *Relative clause.* A relation between a relative clause and a relativized NP/VP. The finite verb
isa SYNADJ in the relative clause is analyzed as a ”rel” dependent of the head of the relativized NP/VP
[117] (ie, the determiner if present, otherwise the noun). If there is a relative pronoun, it receives an incoming ”ref” arrow from the head of the relativized NP/VP; otherwise, the head of the relativized NP/VP must function as a secondary dependent of some word within the relative clause (often the relative verb itself).
Subtypes: relelab relpa relr.
Related types: relelab relpa relr.



relelab *Elaborating relative clause.* Ledsætning med sætningsantecedent i hovedsætning; da: hvilket,
isa rel it: il che, cosa che

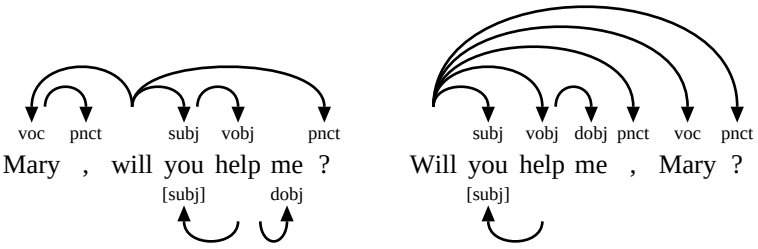
voc *Vocative.* Vocative specification. The person to whom the statement is directed.
isa SYNADJ
[127]



xtop *External topic with resuming pronoun.* An external topic is a sentence-initial NP whose only
isa SYNADJ function is to provide the antecedent for a pronoun later in the sentence. Eg in ”John, he is a
[121] nice person”. Here ”John” is the ”xtop” of ”is”, and ”he” is the subject of ”is”.

Subtypes: "¤"PRIM DISCOTHER DISCPRAG DISCSEM.

"¤"PRIM *Discourse specification.* A primary syntactic relation that has been used as a discourse relation for stilistic purposes.
isa DISC RULE [353]

DISCOTHER .
isa ADJ DISC [201]
Subtypes: JOINT REP SCENE.

JOINT *No clear relation.* The dependent text segment adds a completely new content without any clear discourse relation to the governing segment
isa DISCOTHER [251]
Confusion$_4$: CONJ:add$_{50\%}$ JOINT$_{50\%}$.

REP *Repaired* (deprecated STRUCT:rep). Dependent text segment is interrupted and unfinished and "repaired" by the following and governing text segments, which completes it
isa DISCOTHER [250]

SCENE *Scene* (deprecated STRUCT:prepPREP). Dependent text segment expresses the scene of the following and governing text, e.g. headings, titles

5.1 Functional relations: DISCFUNC

DISCPRAG isa ADJ DISC [200] *Pragmatic and illocutionary discourse relations* (deprecated DISCFUNC). The dependent text segment expresses a change in speech act or pragmatic function (speaker's intention) wrt the governing segment; the label indicates the speech act or function of the dependent segment; regarding speaker's intentions and speech acts we consider the narrating asserting speech act as our default value.

Subtypes: ANSW CONSOL DIREC EXPR INTACT QUEST.

ANSW isa DISCPRAG [238] *Answer.* Governing text segment contains question or problem, dependent text segment answer or solution

Confusion$_1$: ANSW$_{100\%}$.

CONSOL isa DISCPRAG [244] *Consolidation* (deprecated SUPPORT?).

Subtypes: CONSOL:inst CONSOL:motiv CONSOL:source.

CONSOL:inst isa CONSOL [246] *Instrumental* (deprecated CONSOL:enabl). S is instrumental in helping reader or recipient to carry out the action mentioned in N; frequent in directive texts

CONSOL:motiv isa CONSOL [247] *Motivation.* S motivates reader or recipient to carry out the action mentioned in N

Confusion$_1$: AGENTIVE:expl$_{100\%}$.

CONSOL:source isa CONSOL [245] *Justification* (deprecated JUSTCONSOL:just). S expresses a source that justifies N wrt its content (reason for mentioning it or sim.) thereby strengthening it argumentatively

Typical connectives: [da] Fordi, Eftersom.

Confusion$_2$: CONJ:elab$_{50\%}$ AGENTIVE:expl$_{50\%}$.

DIREC isa DISCPRAG [239] *Directive act.* Dependent text segment contains an order, command or request

e.g. imperatives

EXPR isa DISCPRAG [240] *Expressive act.* Dependent text segment contains an expression of the speaker's attitudes or emotions, e.g. congratulations, excuses or thanks

[en] I'm sorry!; My condolences!

INTACT *Interactional signals.*
isa DISCPRAG

Anaphor relations: ANAPHORA

ANA: anaphoric level
    anaphor:

Figure 6.1: The relations matching ANAPHORA-coref-assoc-TOPICS.

ANA isa DIM:LEVEL [20] *Anaphoric level* (long: ANAPHORA). An anaphoric relation. Ie, a relation between an anaphor (pronoun, definite description, etc.) and an antecedent which either is a coreferent, or which provides access to a coreferent via its qualia structure. The relation goes from antecedent to anaphor.

Subtypes: anaphor.

anaphor isa ANA [181] . This section concerns anaphors as well as cataphors; cataphors may by and large express the same relations with their postcedents as anaphors with their antecedents; the relations are therefore labelled identically and will be distinguished solely by the edge direction: from left to right (anaphors) or from right to left (cataphors); because of their much higher frequency, we shall limit ourselves to examples of anaphors

Subtypes: assoc coref.

6.1 Coreference relations: coref

coref: coreference
    coref-iden: coreferential NP with lexical identity
    coref-res: resumptive anaphor
        coref-res.prg: pragmatic coreference
    coref-var: coreferential NP with lexical variety
    ref: syntactically determined coreference

Figure 6.2: The relations matching coref.

coref isa anaphor [182] *Coreference*. Anaphor denotes same entity as antecedent; all coreferential pronouns are labelled this way

Subtypes: coref-iden coref-res coref-var ref.
Confusion$_1$: coref$_{100\%}$.

coref-iden *Coreferential NP with lexical identity* (deprecated coref-id).
isa coref

coref-res *Resumptive anaphor* (deprecated nowincludescoref-res.cause).
isa coref Subtypes: coref-res.prg.
[186] Confusion$_1$: coref-res$_{100\%}$.

coref-res.prg *Pragmatic coreference.* Takes up a statement and evaluates it with respect to speech act; I will be there tomorrow -> the threat / promise / warning / statement
isa coref-res
[187]

coref-var *Coreferential NP with lexical variety.*
isa coref
[185]

a car −> the vehicle // a yellow car −> the car

ref *Syntactically determined coreference.* Syntactically determined coreference (eg, relative pronouns, external topics)

a car −> the factory; a piece of music −> the composer

assoc-const isa assoc [191] *Associative anaphor (constitutive)* (deprecated assoc-loc?). Anaphor is associated with antecedent wrt its constitutive qualia (parts, material, etc.)

ex. a car −> the wheels, the numberplate, the driver's seat; a hotel −> the kitchen; a bunch of flowers −> the roses; a couple −> the man; the Italian partitive "ne", ex. some wine −> ne vuoi (un po')?

assoc-formal isa assoc [193] *Associative anaphor (formal).* Anaphor is associated with antecedent wrt its formal qualia (shape, dimension, colour, etc.)
Subtypes: assoc-formal.loc.

a car −> the size, the colour; a building −> the height

assoc-formal.loc isa assoc-formal [194] *Associative locative anaphor.* The anaphor is located in the antecedent

a village −> the church, the inn, the train station

assoc-telic isa assoc [195] *Associative anaphor (telic)* (deprecated assoc-scope?). Anaphor is associated with antecedent wrt its telic qualia (purpose, function, etc.)

a car −> the driver, the passengers; a hotel −> the guests, the receptionist

7.2 Thematic role relations: SEMROLE

SEMROLE . A semantic relation. All the relations of the semantic roles run under the text line. The syntactic relation that runs over the text line is determined by the word class of the lemma in question. In NP constructions, the syntactic head of an adjunct is assumed to also act as the semantic head of the adjunct, ie, the semantic relation mirrors the syntactic relation in this respect.

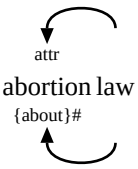
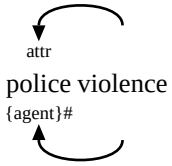
{recipient}: The receiver of something
{resem}:
{source}:
{time}:

Figure 7.3: The relations matching SEMROLE.

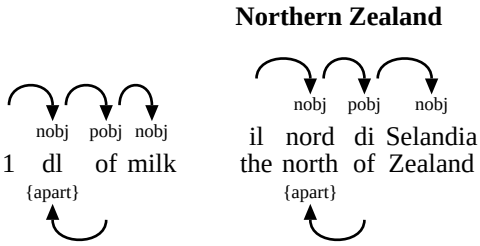


{agent} isa SEMROLE [50] *An object or a person that performs an action.* Used in noun phrases where there the satellite is the person or object that performs the volitional action indicated by the nucleus.An object or a person that performs an action. Used in noun phrases where there is a deverbal relation between the nucleus and the satellite. Often realized as a subject.
Confusion$_{16}$: {agent}$_{38\%}$ {arg}$_{25\%}$ {experiencer}$_{19\%}$ {loc}$_{6\%}$ {patient}$_{6\%}$ {source}$_{6\%}$.



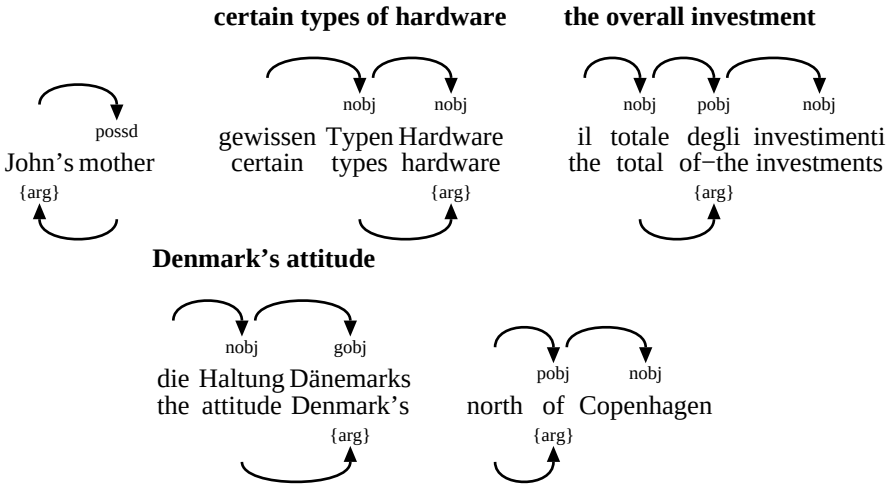
{apart} isa SEMROLE [62] . Used in noun phrases where the satellite represents an arbitary part of the nucleus. Please note that the semantic relation goes from the satellite to the nucleus in opposition to the main part of the other semantic roles.

Confusion$_1$: {const}$_{100\%}$.



{arg} isa SEMROLE [67] . Used in noun phrases where there is a deadjectival relation or another similiar relationship between the nucleus and the satellite.

Confusion$_{50}$: {arg}$_{34\%}$ {func}$_{16\%}$ {const}$_{10\%}$ {agent}$_{8\%}$ {patient}$_{8\%}$ {source}$_{8\%}$ {about}$_{6\%}$ {loc}$_{4\%}$ {other}$_{4\%}$ {poss}$_{2\%}$.



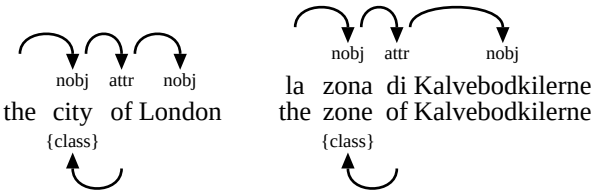
{cause} isa SEMROLE [53] . Used in noun phrases where there the satellite is the person or object that performs the non-volitional action indicated by the nucleus.

ildebrand sultedød

{class} isa SEMROLE [63] . Used in noun phrases where the satellite indicates the super type or classification of the nucleus. This is in opposition to the identity relation which denotates the opposit relationship between the two units. Please note that the semantic relation goes from the satellite to the nucleus in opposition to the main part of the other semantic roles.

Related types: {iden}.

Confusion$_1$: {const}$_{100\%}$.



{const} . Used in noun phrases where the satellite represents a part, material or essential constituent
isa SEMROLE of the nucleus.

f: fuzzy word alignment

Figure 8.1: The relations matching ALIGN-TOPICS.

ALIGN *Alignment level* (long: ALIGNMENT). A relation at the word alignment level. Ie, an alignment relation that expresses a translational equivalence between two sets of words (and their iated phrases), either in terms of form or meaning. Null alignments - ie, a set of words in one text which does not correspond to any set of words in the other text - are encoded as a set of words that is aligned to itself.

isa DIM:LEVEL [19]

Subtypes: "" f.

"" *Unlabeled word alignment* (long: align). An unlabeled word alignment is represented as a word alignment where the label is an empty string. It is used to represent the default word alignment, where there is full translational equivalence between the two sets of words.

Agreement and confusion tables

In the following tables, the columns are interpreted as follows:

- *Relation name R:* the name of the relation.
- *Agreement A:* the estimated level of agreement, defined as the probability that another annotator assigns the same label to the relation (this number may be inaccurate if N is small).
- *Relation count N:* the number of distinct multiply annotated tokens in the corpus that were annotated with the relation by at least one annotator.
- *Confusion table:* the relations that other annotators used, with a percentage that indicates the probability that each relation was used by the other annotator instead of R.
